#### **General Note** 1

Read this document carefully and get used to the operation of the device before you use it. Keep this document within reach for consulting in case of doubt.

If the device is stored at temperatures above 50°C the battery has to be removed from the device.

We recommend taking out battery if device is not used for a longer period of time. Risk of leakage!

(P

# 2 Designated Use

The GMH 3692 is measuring oxygen in air and gas mixtures either as partial pressure or as concentration in %vol.

For the measuring an external sensor of the type GOO-... or GGO... has to be connected to the MINI-DINsocket.

Due to the properties of the sensor, it has to be calibrated regularly (e.g. at fresh air = 20.95%) to get precise values. If the sensor is used up, this will be detected during the calibration, the sensor has to be regenerated or replaced before continuing with measuring.

The safety requirements (see below) have to be observed.

The device must be used only according to its intended purpose and under suitable conditions.

Use the device carefully and according to its technical data (do not throw it, strike it, ...)

Protect the device from dirt.

# **3** Safety

## 3.1 Safety signs and symbols

Warnings are labeled in this document with the followings signs:

**Caution!** This symbol warns of imminent danger, death, serious injuries and significant damage to property at non-observance.

**Attention!** This symbol warns of possible dangers or dangerous situations which can provoke damage to the device or environment at non-observance.

**Note!** This symbol point out processes which can indirectly influence operation or provoke unforeseen reactions at non-observance.

## 3.2 Safety guidelines

This device has been designed and tested in accordance with the safety regulations for electronic devices. However, its trouble-free operation and reliability cannot be guaranteed unless the standard safety measures and special safety advises given in this manual will be adhered to when using the device.

 Trouble-free operation and reliability of the device can only be guaranteed if the device is not subjected to any other climatic conditions than those stated under "Specification".
If the device is transported from a cold to a warm environment condensation may cause in a failure. In such case make sure the device temperature has adjusted to the ambient before trying a new start-up.

2.

If there is a risk whatsoever involved in running it, the device has to be switched off immediately and to be marked accordingly to avoid re-starting.

Operator safety may be a risk if:

- there is visible damage to the device

- the device is not working as specified

- the device has been stored under unsuitable conditions for a longer time.

In case of doubt, please return device to manufacturer for repair or maintenance.

Do not use these products as safety or emergency stop devices or in any other application where failure of the product could result in personal injury or material damage. Failure to comply with these instructions could result in death or serious injury and material damage.

This device must not be used at potentially explosive areas! The usage of this device at potentially explosive areas increases danger of deflagration, explosion or fire due to sparking.

# 4 Product Description

## 4.1 Scope of supply

The scope of supply includes:

- GMH 3692 with 9V-battery
- Operating manual

The necessary oxygen sensor is chosen separately due to application.

## 4.2 Operation and maintenance advice

1. Battery operation

If  $\triangle$  and 'bAt' are shown in the lower display the battery has been used up and needs to be replaced. However, the device will operate correctly for a certain time. If 'bAt' is shown in the upper display the voltage is too low to operate the device; the battery has been completely used up.

The battery has to be taken out, when storing device above 50 °C. We recommend taking out battery if device is not used for a longer period of time.

After recommissioning the real-time clock has to be set again.

2. Mains operation with power supply

When using a power supply please note that operating voltage has to be 10.5 to 12 V DC.

We, therefore, recommend using regulated voltage power supplies.

Trouble-free operation is guaranteed by our power supply GNG10/3000.

Prior to connecting the power supply to the mains make sure that the operating voltage stated at the power supply is identical to the mains voltage.

3. Treat device and sensor carefully. Use only in accordance with above specification. (do not throw, hit against etc.). Protect plug and socket from soiling.

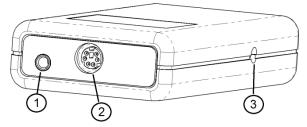

## 4.3 Start of Operation

Switch the device on with the key "ON OFF". The Instrument is performing a self diagnosis, during this time all display segment are shown.

Afterwards the instrument signals, if it was user adjusted ("Lorr") The device starts measurement afterwards.

1.

#### 4.4 Anschlüsse

**Output:** Operation as interface for t he connection of galvanically isolated adapters (accessories: GRS 3100, USB 3100)

Attention: The mode of operation has to be configured (p.r.t Chapter 5) and influences the power consumption.

- 2. Sensor connection MiniDIN
- 3. Power supply: d.c.connector (internal pin Ø 1.9 mm) for external 10.5-12V direct voltage supply

## 4.5 Display elements

1 = Main Display:

2 = secondary

**Special elements:** 

3 = MIN/MAX/HLD:

4 = ok-arrow:

5 = CAL- arrow:

6 = Logg - arrow

7 = Warning sign:

display:

Possible displays:

- Oxygen concentration in % (%  $O_2$  Vol)
- Oxygen partialpressure (hPa or mmHg) (change with st.-key)

Display of sensor temperature or absoute pressure (alternating, please refer to Chapter 5. Lcd.2)

Shows, if minimum/maximum/ memorized measuring value is in display Signals, if oxygen and temperature values are stable Signals, if automatic calibration is in progress No function Signals weak battery or other warning message

Die restlichen Pfeile haben in dieser Gerätevariante keine Funktion

2

## 4.6 Pushbuttons

MIN HLD

3

# On / off key

#### Set/Menü

Press 2 sec.: (Menu): call configuration menu Press shortly: Change the oxygen display unit (please refer to chapter 5)

#### min/max when taking measurements:

press shortly: min. or max. measured oxygen value and referring temperature and pressure values will be displayed

press for 2 sec.: the min. or max. value will be deleted

Configuration: to enter values, or change settings

#### Store/Enter

Measuring:

with Auto-Hold off: hold and save current measuring value ('HLD' is displayed) with Auto-Hold on: start new measuring, It is finished , when "HLD' shows in display Set/Menu: confirm settings, return to measuring

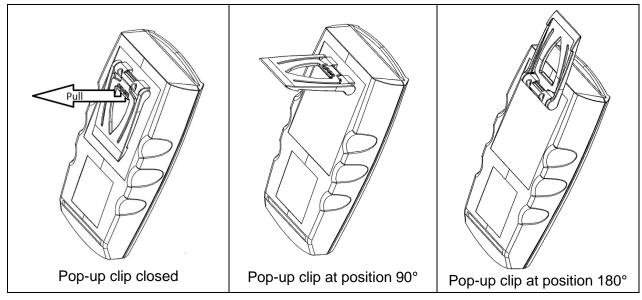

#### CAL:

press shortly: display of sensor state rating press for 2 sec: start sensor calibration

#### Pop-up clip Handling:

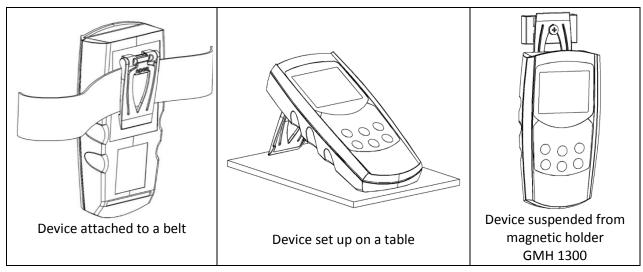

4.7

- Pull at label "open" in order to swing open the pop-up clip. •
- Pull at label "open" again to swing open the pop-up clip further.

#### Function:

- The device with a closed pop-up clip can be plainly laid onto a table or attached to a belt, etc.
- The device with pop-up clip at position 90° can be set up on a table, etc.
- The device with pop-up clip at position 180° can be suspended from a screw or the magnetic holder GMH 1300.

#### Configuration 5

Some menu points depend on current device settings.

To change device settings, press "Menu" 🚨 for 2 seconds. This will activate the configuration menu (main display: "Set"). Pressing "Menu" 🚨 changes between the menus points, pressing 🔑 jumps to the referring parameters, which can be selected with key <sup>5</sup>.

The parameters can be changed with 📩 or 🟸. Pressing **"Menu"** again jumps back to the main configuration menu and saves the settings. "Quit" En finishes the configuration and returns to standard measuring operation.

Pressing "menu" and "store" at the same time for more than 2 seconds will reset the device to factory defaults

If no key is pressed within 2 minutes the configuration will be aborted. All changes will not be saved!

#### Operating Manual GMH 3692

# 6 Oxygen Measuring in Gases- Please Note

The GMH 369x is designed for measuring the oxygen partial pressure or the oxygen concentration (%vol, calculated from partial pressure and ambient pressure) in gases. Please keep in mind:

- The sensor hast o calibrated regularily, e.g. at fresh ambient air
- The calibration and the measuring are pressure depending!

The instrument automatically measures the ambient pressure, be sure, that instruments pressure is the same like the pressure at the sensors membrane. For the full automatic compensation a precision pressure sensor is integrated in the instrument.

• The sensor temperature has to be the same like the gas temperture! Temperature differences may falsify the results! Please have in mind that temperature adoption of the sensor and the air may take several hours. A suitable ventilation or gasflow around the sensor would speed up this process significantly.

The sensor consists of a sensing element (GOEL xxx) enclose in a sensor housing (GGO/ GGA/GOO). When purchasing a Sensor GGO/GGA/GOO xxx, a sensor element is already integrated, e.g. a GGO 370: contains housing GGO and a sensor element GOEL 370.

## 6.1 Choice of Sensing Elements#

#### GOEL 370:

Universal sensor element with special protection measures especially for diving application ("Nitrox"). Very long life time, also suitable for application with larger  $CO_2$  concentrations.

#### GOEL 380:

Fast responding for low oxygen concentration e.g. protection atmosphere below 1%, max 25%. For application without larger  $CO_2$  concentration.

Sensors are not allowed to used in "under-Water-Diving-Application (e.g. Rebreather)

## 6.2 Application of the different sensor types GGO ..., GOO ... and GGA

#### GGO (closed sensor)

**For measurements at atmosphere** and in systems without over or under pressure the GGO... is sufficient. Additionally the GGO can be screwed tightly into systems with small over or under pressure. Attention! Mind the maximum pressure and the maximum pressure difference at the membrane. If instrument and sensor pressure are different, it will be compensated wrong!

#### GOO 370 / 380 (open sensor)

The sensor is equipped with drillings at the end and because of its special construction the measuring gas streams optimally around the sensor. No pressure can appear while gas blows to the sensor, which otherwise would result in erroneous measures. The temperature compensation speed of the sensor also is optimised by this design.

**Especially the measuring of gases from compressed gas bottles**, where the expansion of the gas leaving the bottle lowers the temperature, is optimised with regard to the temperature compensation and pressure errors. The gas flow should be chosen in a suitable range, where no overpressure can happen, esp. if the sensor is connected directly to the source e.g. by means of a tube.

#### GGA (closed sensor with pressure port) Not suitable for GMH 3692

# 7 Calibration of the Sensor

In order to compensate for ageing of the sensor, the sensor has to be calibrated at regular intervals. The device is equipped with an easy-to-use calibration functions.

We recommend to calibrate the sensor at least all 7 days, or to get maximum precision, before each measuring series.

#### 7.1 One Point Calibration ('[RL !-PL')

The calibration adjusts the sensor to the oxygen content of the atmosphere (20.95%). Therefore simply expose the sensor to the ambient air (sufficient ventilation in closed rooms has to be ensured)

#### Start calibration: press 😤-key for 2 seconds

The display will show ' $\mathcal{P}_{\mathcal{F}} \cap \mathcal{P}_{\mathcal{E}}$ . Is and as soon the values for oxygen and temperature are stable, the calibration will be finished

Then the electrode state resulting of the successful calibration will be shown for a short time (evaluation in 10% steps: xx% ELEE).

#### 7.2 2 / 3-Point Calibration ('[AL 2-PL, [AL 3-PL']

The sensor will be automatically calibrated to the oxygen content of the atmosphere (20.95%) and one or two additional concentrations. As reference gases usually Nitrogen (0% vol  $O_2$ ) or pure oxygen are used

1. Start calibration: press 😤-key for 2 seconds

#### 2. First calibration reference: (Pt.1)

As first reference at a 3-point calibration, the zero reference has to be applied (null),

at a 2-point calibration either 100% or 0%(nuLL).

The display will show PE. IS, and the referring reference which should be applied:

- null for 0% oxygen

#### - **0.2** for pure oxygen

As long as the display blinks, no valid reference is recognised by the instrument.

As soon the values for oxygen and temperature are stable, the calibration of the first point will be finished. The instrument tells you to apply the next reference (possible references are blinking in the display).

#### 3. Second calibration reference: (Pt.2)

The display will show PL25, and the referring reference which should be applied:

- R, r for ambient air
- 0.2 for pure oxygen
- null for 0% oxygen

As long as the display blinks, no valid reference is recognised by the instrument.

As soon the values for oxygen and temperature are stable, the calibration of the second point will be finished. At 2-point calibration the calibration will be finished and the electrode state resulting of the

successful calibration will be shown for a short time (evaluation in 10% steps: xx% ELEC).

At 3-point calibration the instrument tells you to apply the next reference (possible reference is blinking)

#### 4. Third calibration reference: (Pt.3)

The display will show **PL35**, and the referring reference which should be applied: As soon the values for oxygen and temperature are stable, the calibration of the second point will be finished. At 2-point calibration the calibration will be finished and the sensor state resulting of the successful

calibration will be shown for a short time (evaluation in 10% steps: xx% ELEC).

In case of error messages being displayed during the calibration process, please refer to our notes at the end of this manual! If a calibration cannot be carried out after an extended period of time, at least one of the measuring values is unstable (oxygen partial pressure, temperature). Please check your measuring arrangements!

## 7.3 Evaluation of Sensor State (ELEC)

Watch sensor state: press key "CAL" shortly oncedisplay show for a short time xx% ELEC.

It will show the electrode state resulting of the last successful calibration carried out.

The valuation is displayed in 10 percent steps: 100% means optimal sensor condition. Lower values are indicating that the sensor life time will be reached soon.

Remark: But also an erroneous pressure may be the cause of low valuation values.

# 7.4 Calibration Interval (Lint)

You can enter the interval after which the device reminds you to recalibrate in the configuration. The interval times should be chosen according to the application and the stability of the sensor. "CAL" flashes on the display as soon as the interval has expired.

# 8 Inspection of the accuracy / Adjustment Services

The instrument can be sent to the manufacturer for adjustment and function test. Only the manufacturer can check all systems on correct them if necessary.

Calibration certificates – DKD-certificates – other certificates:

If device should be certificated for its accuracy, it is the best solution to return it to the manufacturer. (please specify references, e.g. 20.9 and 100%).

If the instrument is certified with its sensor, this proves for example the linearity of the measuring chain, regular recalibration by the user is still necessary!

# 9 Serial Interface

With an electrically isolated interface converter USB3100, GRS3100 or GRS3105 (accessory) the device can be connected to a PC.

With the GRS3105 it is possible to connect up to 5 instruments of the GMH3000 family to a single interface (please also refer to GRS3105-manual). As a precondition the base addresses of all devices must not be identical, make sure to configure the base addresses accordingly (refer menu point "Adr." in chapter 5). In order to avoid transmission errors, there are several security checks implemented (e.g. CRC).

The following standard software packages are available for data transfer:

- **GSOFT3050**: Operating and evaluation software for instruments with integrated logger function
- EBS20M/ -60M: 20- / 60-channel software to record and display the measuring values
  - **GMHKonfig**: Software for a comfortable configuration of the device (e.g. freeware)

In case you want to develop your own software we offer a GMH3000-development package including

- an universally applicable 32bit Windows functions library ('GMH3000.DLL') with documentation that can be used by all 'serious' programming languages.
- Programming examples for Visual Studio 2010 (C#, C++), Visual Basic 6.0<sup>™</sup>, Delphi 1.0<sup>™</sup>, Testpoint<sup>™</sup>, Labview<sup>™</sup>

#### The Device has 4 Channels:

- oxygen concentration % Vol
- oxygen partial pressure in hPa or mmHg
- temperature value at the time of recording in °C or °F
- absolute pressure in hPa abs or mmHg abs

#### Supported Interface-functions:

| 1 | 2 | 3 | 4 | Code | Name/Function                      | 1 | 2 | 3 | 4 | Code | Name/Function                  |

| х | х | х | х | 177  | read max measuring range           | х |   |   |   | 222  | read turn-off-delay            |
| х | х | х | х | 178  | read measuring range unit          | х |   |   |   | 223  | Set turn-off-delay             |
| х | х | х | х | 179  | read measuring range decimal point | х |   |   |   | 240  | Reset                          |
| х | х | х | х | 180  | read measuring type                | х |   |   |   | 254  | read program identification    |

The measuring and range values read via interface are always in the selected display unit!

# 10 Alarm ("AL.")

There are three possible settings:

Alarm off (AL. oFF), on with buzzer (AL. on), on without buzzer (AL. no.So).

Following conditions will display an alarm, when the function is activated (on or no.So):

- Value is below lower (AL. Lo) or above upper alarm rail (AL.Hi).
- Sensor error
- Low battery (bAt)
- Err.7: System error (always with buzzer)

In case of an alarm and when polling the interface the "prio"-flag is set in the returned message.

| <b>11 Error and</b> | System Messages  |  |  |  |  |
|---------------------|--|--|--|--|--|
| Display             | Meaning  | Remedy   |  |  |  |

| Err.7               | system error   | return to manufacturer for repair  |  |  |  |

If "**bRL**" is flashing, the battery will be exhausted soon. Further measurements are possible for short time.

If "**bRL**" is displayed continuously the battery is ultimately exhausted and has to be replaced. Further measurements aren't possible any more.

# 13 Reshipment and Disposall

Dispense exhausted batteries at destined gathering places.

This device must not be disposed as "residual waste". To dispose this device, please send it directly to us (adequately stamped). We will dispose it appropriately and environmentally friendly.

All devices returned to the manufacturer have to be free of any residual of measuring media and other hazardous substances. Measuring residuals at housing or sensor may be a risk for persons or environment

Use an adequate transport package for reshipment, especially for fully functional devices. Please make sure that the device is protected in the package by enough packing materials.
